Name:
Project title:
Date: November 27, 2026

INSTRUCTIONS: *Complete this form and submit it in lieu of Sketch #3.*

1. PROJECT INFORMATION

What kind of interactive audiovisual work will I make?

- ☐ *Performance*
- ☐ *Installation*
- ☐ *Screen or computer-based work*
- ☐ *Other. Please specify:*

What is your concept?

What gesture(s) will you use and how does it relate to the concept?

What interactive technology allows you to best capture or transform your gesture into digital space?

Provide a link to documentation of your interactive prototype (a video that shows your prototype working and functional):

2. INTERACTIVE EXPERIENCE

Describe the interactive component of your project. Write one line for each interaction that you want to happen. Keep it simple for your first time prototyping. One successful interaction is better than many that don't work.

#	**1. Input** *Who/what is the thing that performs an action?*	**2. Action** *What is the action that triggers an event?*	**3. Response** *What is the event caused by the trigger?*	**4. Feedback** *How does the participant experience the response?*
ie.	*When a person….* *When I…* *When my collaborator…*	*…walks across the camera view…* *…presses a button…*	*…3 different sounds will play based on the person's location on the screen.* *… a new video plays.*	☑ ~~Immediately~~ ☐ Delayed ☐ Gradual ☐ Continuous ☐ Momentary ☐ If other, specify:
A				
B				
C				

Are there any other experiential / interactive things to consider?

3. DETAILED INTERACTION MAP

How do you go from planning an interactive experience to implementing it? *Below are the steps to processing an input. Start with the columns highlighted in green. They are the most essential to know. The others (Pre-processing, Measuring, and Smoothing) are often figured out in the prototyping process and can change based on what works during testing. Different types of inputs will require different types of processing, measurement, and smoothing depending on the detection type and target.*

Fill in the chart as best you can before prototyping, then revise after, filling in the sections as you figure them out. One row = one input source (max 3). Use the workshop handouts to help you pick terms if you aren't sure what things are called. If you are unsure about something, highlight it so you know you need to figure it out.

#	**1. Interaction Input + Device** *What device, UI, or data source am I using?*	**2. Pre-processing** *Do I need to modify or prepare the incoming data before using it?*	**3. Detection type / technique** *How will the system identify an action, object or event?*	**4. Analysis / Measurement** *What information am I extracting?*	**5. Data smoothing?** *Do I need to stabilize or gradually transition the data?*	**6. Parameter mapping** *How will I translate the measurement into a control value or event?*	**7. Target / Output** *What will the measurement control?*
ie.	*Webcam to Max/MSP (jit.grab)*	*Mirror Downsample Grayscale Threshold*	*Motion detection, using frame difference*	*Zones + Averaging: 3 vertical strips + avg. per zone*		*One-to-one: event trigger when the active zone changes*	*Each zone strip starts a different sound loop.*
A							
B							
C							

NOTE: Not every input requires every processing stage. Some inputs can be used directly, others require several stages of processing. If you aren't sure ask for help.

5. SKETCH OF SPACE / SETUP

Draw (or paste a photo of) a top-down view of your installation plan: Include sensor/equipment positions, where people stand, what the sensor "sees," and any zones overlaid on the camera view.

Preferred presentation space:

- ☐ Project Lab (EV S2)
- ☐ Mini Black Room (EV S2)
- ☐ Twin Studios (EV S2)
- ☐ Screening Room (EV S2)
- ☐ Production Studio (EV 6)
- ☐ Installation Edit Suite (EV 6)
- ☐ IMCA Classroom (EV 6)

5. EQUIPMENT NEEDS

What equipment do you need to make this happen? Remember that you might also need cables, power extensions, and other equipment besides the interactive technology you are planning to use. List the specific details of what you need. Include cable lengths, types, and so on. Only use as many line items as you need.

Item	Where will I get it?	Booked?
		☐
		☐
		☐
		☐

		☐
		☐

6. MAX/MSP/JITTER TOOLS + OTHER SOFTWARE NEEDS

Will you follow any tutorials to help you achieve your interactivity goals? List them below.

- *Ex. YouTube - Motion Demo - jit.scissors*

Which Max packages, externals or integrations will you use? Check all that apply.

☐ cv.jit (computer vision)	☐ CNMAT Externals (OSC)	☐ NDI (network streaming)	☐ Vsynth (Video synthesis)
☐ Vision (computer vision)	☐ Syphon / Spout (cross-platform streaming)	☐ UltraLeap (Leap Motion Controller)	☐ Miraweb (Patch control)
☐ Vizzie (Max video modules)	☐ Beap (Max sound modules)	☐ Max4Live (Ableton)	☐ AV Toolbox (audio-reactive tools)

If others, list them here:

Are there any other digital software tools or communication protocols that you will use? List them below.

If choosing an approach not using Max/MSP, describe your plan.

- *Ex. TouchDesigner to create generative visuals and Ableton to design an audio track, sending MIDI from Ableton to control the visuals in TD.*

7. WHAT COULD GO WRONG? WHERE DO YOU NEED HELP?

Do you foresee any technical challenges? What are your contingency plans for problem solving these issues? What help will you seek?

Problem	**How I'll handle it**
Examples: - *Lighting changes / low light / auto-exposure* - *More than one person in view* - *Jumpy or noisy tracking*	

Is there anything you foresee needing help with to be able to bring your project to life? Who would you ideally have help from?

Does my system require calibration before participants can interact with it? If so, how will this happen?

Additional Notes:
